

INSTRUCTIONS FOR APPLYING LASH CRYSTALS

Products needed:

- Xtreme Lashes® Swarovski Lash Crystals
- Superfine Microfiber Brushes
- XL *FlexFusion*™ Adhesive
- XL Touch Fan
- Curved Tweezers
- Straight Tweezers
- 4 x 6 Application Sponge

Crystal Pickup: (Note: It is easiest to pick crystals up with straight tweezers because they have a wider tip.)

1. Open your canister of Lash Crystals, and using a clean set of straight tweezers, take out the desired amount of crystals and place them on the application (4x6) sponge.
2. Ensure that the crystal is facing up and the flat back is lying on the sponge.
3. Using your straight tweezers, gently clamp onto the sides of the crystal and lift off of the sponge.

Prep: Plan your crystal design and apply a full set of lashes from 75-100+.

- The best Lash Crystal application results will be obtained when they are applied to a very full application of lash extensions. Fuller extension applications provide better support for the Lash Crystals and help disguise the base of the Lash Crystal so that it will not be noticed by the client when she opens her eyes.

Step 1: Apply a new drop of adhesive in your adhesive tray.

Step 2: Prepare your Superfine Microfiber Brush by removing the microfiber tip, leaving only a plastic tip.

Step 3: Remove the necessary quantity of Lash Crystals from the canister and place them on the sponge. Adjust crystals so they are lying on the flat back side.

Step 4: Isolate the desired extended lashes according to your design.

Step 5: Once isolated, use the Superfine Microfiber Brush and touch the tip into the adhesive, creating a single bead of adhesive on the end. Coat the small section of the extended lash where the crystal will be applied.

Step 6: While holding the isolation, pick up a Lash Crystal from the application sponge.

Step 7: Still holding the isolation, position the crystal where the adhesive has been coated on the extended lash. Hold the crystal in place for 5-10 seconds.

Step 8: Still holding the isolation, slowly release the crystal onto the extended lash.

Step 9: Still holding the isolation, fan the lash for 5-10 seconds with your XL Touch Fan to help set the bond of the crystal.

Step 10: Release the isolation.
